

Binary Processing and The Art of Prophecy.

The Art of Prophecy is afforded to a sapient species through that life support system called mind via language. Language is Universal and Intelligible. The universal is the intelligible of a thing, a unit, or again a Conjugate Binary Pair, or simply binary. One's inherited intelligence determines how well one comprehends and can effect binary via grammar. The simple minded see binary information processing as particular symbols in one grammar, 0 and 1, a very intelligent individual sees binary as the intelligible parts of a thing and expressed as binary processing in every possible grammar. An example of such an individual was Plato, the greatest example, however, are those responsible for compiling the Bible to effect guided evolution. They are capable of an analog grammar called telepathy; we possess very, very rudimentary elements of that ability.

What is the purpose of evolution?

I would claim that in the simple, it is to maintain and promote life. In the simple, life, by recursion, constructs living things, from single cell self-cloning to gardening a whole planet. One can say that single cell replication is an example of an arithmetic progression, while sexual reproduction is a geometric progression. Thus we have two concepts by two methods of reproduction. Reproduction in the perceptible, physical world, and reproduction in the intelligible world. One is called sex, the other education or guided evolution. One can say that the Universe is divided between the animate and inanimate, life being some undefined, but only namable difference in the Universe, a class which we find ourselves in. Every form of life is then a product of evolution using the material difference of life. Some evolve faster, some slower, and some have stopped evolving altogether, and some appear to have stopped, depending on the time frame one examines.

What is the common characteristic between animate things and inanimate things?

The simple fact that they are both things. The term thing evokes a binary concept in recognition, some thing and no thing.

What is a thing?

In the simple one can say objects of perception. Object is just a synonym for thing to begin with. Arithmetic thinkers generally run themselves tired by the use of synonyms. In such cases it would be preferable to say a thing is that to which a life support system of a thing responds, which still invokes a self-referential description. It amounts to, I am a thing, and what I am not is also a thing. Or again, this and that, indicating not only a response but a form of universal response, but still arithmetic. Plato defined existence in terms like this, the power to effect a change, no matter how small in any other thing.

In the intelligible, a thing is a simple binary of a relative constrained by absolutes, or correlatives, off, on, off. Some would say a quanta of energy,

others would say a simple logic gate. Sapience evolves to use binary to construct, maintain, and use memory in order to predict behavior in order to produce favorable life sustaining behavior. One can say that prophecy is the recursion of memory and to emphasize that it is a binary process, the Bible examples the construction of a whole genre, or class, of kosher foods. Metaphor is a method of instilling universal concepts in a mind only capable of particular memory functions in order to add intelligible stress to a primitive species. Evolution requires stress.

The Bible, or Book, is a particularly solid and primitive metaphor for distinguishing forms of life in accordance with a particular life support system, the ability to read. Now, if you are simple minded, you take the terms book and reading to mean some particular class of objects to which particular classes of behavior are expressed. However, if, by the auspices of evolution, you evolve beyond the particular into the intelligible, you may see those terms as expressing universal concepts.

A mind is a symbolic information processor, this means that all it can do is read to effect standards of sapient response. Reading ability is determined by one's biological inheritance of intelligence. By definition, the human race is proto-linguistic, binary is the root unit which provides recursion in any possible grammar. It is not a particular bright behavior to go looking for the source of grammar as a perceptible, and Plato spoofed etymologist, but not one of them apparently got the jokes. If one is born with the ability to read and speak, it should be obvious that there are standards upon which every possible grammar is effected. However, the greatest minds of our time are still too stupid to see it. Maybe they need some more video games. At some point they are bound to notice the computer they are playing on. However, that might be as fruitful as asking the religious or the scientist to tell you exactly what does the 1 mean in One God, or 1 in complete induction and deduction. Evolution is not a pretty sight, but it is a necessary experience.

My project is divided in accordance with the intelligible evolution of man using four books, the first is simply called Book, or Bible. That Book informs man, several times in the text, explicitly and by the use of linguistic puzzles, that the human race will not be able to even read it until a particular time in human history. Man's ability to read that Book will then evolve over time through his history.

The second is the *Elements* of Euclid. The *Elements* by Euclid is an analog grammar book. It effects grammar by pairing the intelligible two elements of a thing with the perceptible behavior of the hand. It is a simple binary pairing, however mankind still does not display the intelligence behind the pairing.

Third are the *Dialogs* of Plato. Plato was a grammar teacher and he expressed binary information processing using the word Dialectic and established the Art of Dialectic as the Craft of a Philosopher. Mankind still uses the words but are wholly ignorant of their definitions.

Fourth is my own work, Basic Analog Grammar, or if one prefers, Basic Analog Mathematics. Binary in the intelligible multiplied by binary in the perceptible produces exactly four categories of grammar, common grammar, arithmetic, algebra, and geometry. Language effects a four-dimensional intelligible behavior for grammatical proficiency.

While we have yet to learn even this basic matrix using the analog grammar of geometry, our alien neighbors have displayed, if we recognize historic records, and from my own personal experience, analog grammar called telepathy. We are a long ways from that ability. We are so far in being intellectual midgets in the universe, we do not even have one correct grammar book on the planet. From time to time in our history, aliens have used particular individuals to help in the process of our evolution, but in no case can one call most if not all of those interventions a conversation. Man is not yet smart enough to hold one, only the arrogant and uninformed would claim that we are. Brainiacs claim that telepathy cannot be proven, which is an amazing statement as, not being any correct grammar book on the planet, they can not prove a thing to begin with. If they do arrive at any conclusion they then show their schizophrenia by amending the conclusion by saying something like, at least by Newtonian Mechanics, but by Quantum Mechanics we get, lost. In short, too dimwitted to know a unit is a unit, by arithmetic recursion or geometric recursion, induction or deduction. Exactly how stupid do you have to be to claim that the product of any symbolic manipulation is determined by the auspices of some god, man, theory, or doctrine? What is a grammar matrix? What is Nomocracy?

If the principles of Language are demonstrably a universal constant, then is not Law a universal constant? Or in metaphor, man is evolving to use the intelligible unit until it is "on earth as it is in the heavens."

So, despite all of the mystical crap by science and religion, guided evolution provides the stress to accomplish correct information processing be it for an individual or a tribe, clan, country or continent and is also called enculturation, indoctrination, and education. A simple minded species cannot keep track of the names they do attempt to use.
